

END YOUR OIL LEAKS!

OIL SEALS FOR 50DN OIL COOLED ALTERNATORS

B&C Truck Electric carries technically advanced oil seals that drastically reduce the problem that can be found on 50DN Oil Cooled Alternators. This uniquely designed, Double Lipped Seal, traps oil and returns it back into the alternator. With rotor shaft speeds in excess of 17 feet per second, the directional helix channels the oil into circular spiral channels, directing the oil flow back into the alternator and away from the seal lip.

Spacing Collar; Equally Important is an OEM

Plunge Ground Spacing Collar that Marries the Oil Seal Lip surface with the Rotor Shaft. Worn & improperly machined collars will eat up the oil seal lips, causing leaks. Specially Designed Installation Tool; Specifically designed, this special installation tool was built for proper fit and alignment, for the OEM supplier of this Alternator.

When used properly in conjunction with the preceding seal and spacer, oil seal leaks will be reduced to almost none. Note; This is the upgrade for the old style 1988307 Drive End Housing.
